

Triumph Over Kid Cancer Foundation
RESEARCH UPDATE

With your help, one of the research projects TOKC has funded has had excellent results and is moving into its next phase! This project at MD Anderson has identified an inhibitor of the molecule EZH2, called GSK126, that prevents the growth of osteosarcoma cells in the lungs - the same kind of cancer that took James' life.

This means that a target to prevent the growth and development of lung metastasis in patients with osteosarcoma has finally been identified. There are already FDA-approved chemotherapies to treat other types of cancer that use this inhibitor, so the next step will be working to start a clinical trial to provide more treatments in kids with osteosarcoma. For more information, please see the update below, as well as a link to the published article.

While there is more work to be done, this is a HUGE step forward in the fight against pediatric cancers! And we could not have done it without you and your support!

PLEASE give TODAY and always remember that TOKC works with institutions who Match all donations Dollar for Dollar.

Thank you for continuing to provide a promise of hope for a better future for kids with cancer.

Mecklin V. Ragan, MD
James' Big Sister
Co-Founder, Triumph Over Kid Cancer Foundation
